Synthetic histories: triangles add 0.6K; dotted population line is A/K
A shuts down at extinction; B smallness is not finite extinction
Model A: prescribed harvest
Model B: prescribed harvest
Control / critical control
Population x=N/K
Unassisted catch / (rK)
Time $\tau = rt$
dwell=1
dwell=3
dwell=1, unassisted
dwell=1, restocked
dwell=3, unassisted
dwell=3, restocked
